## IMAGE GUIDED DRAINAGE OF INTRA ABDOMINAL ABSCESS

ICD-10-KK65.1,K75.0

**CLINICAL PRESENTATION**

SIGNS AND SYMPTOMS	
Pain	Local tenderness
Fever	
Weight loss	Organomegaly
Anorexia	

**WHEN TO SUSPECT?**

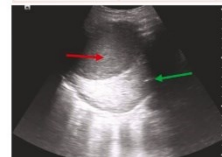

- Patient having unexplained fever especially with chills and rigors
- Local pain: Right hypochondrium (liver abscess), left hypochondrium (splenic abscess), pelvis (post operative status)
- Post operative patient developing fever and increased leucocyte count

**INVESTIGATIONS**

	ESSENTIAL	DESIRABLE
<b>HEMATOLOGICAL</b>	CBC CRP ESR	LFTs HIV serology HBs Ag
<b>IMAGING</b>	USG Abdomen	Contrast enhanced CT study of the abdomen

An abscess forms like a round to irregular collection within the liver parenchyma or other abdominal organs/peritoneal cavity

**A:** Liver abscess  
**B:** Subdiaphragmatic abscess  
**C:** Peri renal abscess  
**D:** Peripancreatic abscess  
**E:** Splenic abscess  
**F:** Paracolic abscess  
**G:** Right iliac fossa/periappendiceal collection

An ultrasound image showing a liver abscess (red arrow) as a hypoechoic area.

A coronal CT scan image showing a liver abscess (red arrow) as a hypodense area.

An axial CT scan image of the abdomen showing a liver abscess (red arrow) as a hypodense area.

An axial CT scan image of the abdomen showing a liver abscess (red arrow) as a hypodense area.

## Standard Treatment Workflow STW in Interventional Radiology

# IMAGE GUIDED DRAINAGE OF INTRA ABDOMINAL ABSCESS

### ICD-10-KK65.1,K75.0

#### CLINICAL PRESENTATION

- Pain
- Fever
- Weight loss
- Anorexia

#### SIGNS AND SYMPTOMS

Pain	Local tenderness
Fever	
Weight loss	Organomegaly
Anorexia	

#### WHEN TO SUSPECT?

- Patient having unexplained fever especially with chills and rigors
- Local pain: Right hypochondrium (liver abscess), left hypochondrium (splenic abscess), pelvis (post operative status)
- Post operative patient developing fever and increased leucocyte count

#### INVESTIGATIONS

	ESSENTIAL	DESIRABLE
<b>HEMATOLOGICAL</b>	CBC CRP ESR	LFTs HIV serology HBs Ag
<b>IMAGING</b>	USG Abdomen	Contrast enhanced CT study of the abdomen

An ultrasound image showing a liver abscess (red arrow) as a well-defined round area appearing less bright than the surrounding liver (green arrow)

A coronal CT scan image of the abdomen showing a large intrasplenic abscess (arrow)

An axial CT scan image of the upper abdomen showing a peripancreatic collection (arrow)

An axial CT scan image of the lower abdomen in a post cholecystectomy patient showing multiple collections (arrows)

#### MANAGEMENT

##### Treatment of an abscess depends on its:

- Location
- Size
- Degree of clinical symptoms (patient with septicemia (tachycardia, hypotension) should be treated aggressively whereas a stable patient can be discharged on oral medical treatment)

- **Medical management**
  - Send the aspirate for microbiological analysis but don't defer treatment for the result of the same
- **Drug dosages:**
  - Inj Metronidazole 500mg IV 6-8 hourly plus inj Ceftriaxone 2gm IV OD for 10-14 days (for liver and splenic abscess)
  - For pancreatic and pelvic/lower abdominal abscesses:
    - Meropenem 1-2gm IV 8 hourly plus Levofloxacin 500-750mg IV daily and Ofloxacin 200 mg for 5-7 days
    - Cefoperazone 1000-2000 mg plus Sulbactam 500-1000 mg (as a combination) IV BD for 5-7 days
- **Surgical management:**
  - To be done in cases of ruptured/impending rupture into the pericardium, peritoneal cavity and pleural cavity
- **Options include:**
  - Laparotomy
  - Chest tube placement/Video-assisted thoracoscopic surgery (VATS)

LIVER ABSCESS	RED FLAG SIGNS	SPLENIC ABSCESS	PERIPANCREATIC ABSCESS	PELVIC ABSCESS
<ul style="list-style-type: none"> <li>• Right upper quadrant pain</li> <li>• May present with pleuritic right sided chest pain</li> <li>• Tender hepatomegaly on examination</li> </ul>	<ul style="list-style-type: none"> <li>• Left lobe abscess</li> <li>• Segment VIII abscess: can rupture into pleura</li> <li>• Superficially located abscess</li> <li>• Abscess volume &gt;100 ml</li> </ul>	<ul style="list-style-type: none"> <li>• Left upper quadrant pain</li> <li>• Tender</li> <li>• Splenomegaly on examination</li> </ul>	<ul style="list-style-type: none"> <li>• Upper abdominal pain</li> <li>• Patient usually has underlying acute/acute exacerbation of chronic pancreatitis</li> </ul> <p style="background-color: #f08080; color: white; padding: 2px;"><b>RED FLAG SIGN</b> May deteriorate rapidly if splenic vein thrombosis occurs</p>	<ul style="list-style-type: none"> <li>• Deep seated pelvic abscess</li> <li>• Common in post operative patients after bowel/ gynaecological surgeries</li> <li>• Tender lower abdomen/ signs of peritonitis/ signs of peritonitis on examination</li> </ul>

#### IMAGE GUIDED DRAINAGE

Consider image guided drainage if the patient has the following despite medical treatment:

- Persistent leucocytosis
- Signs of septicemia: tachycardia, hypotension
- Impending signs of abscess rupture on imaging

Involves Ultrasound/CT guided placement of catheter in the abscess cavity

INDICATIONS	CONTRAINDICATIONS
<ul style="list-style-type: none"> <li>• Patient developing tachycardia and hypotension</li> <li>• Persistent leucocytosis</li> <li>• Impending signs of rupture of abscess into adjacent cavity (pleural/peritoneal/pericardial)</li> </ul>	<ul style="list-style-type: none"> <li>• Uncorrectable coagulopathy</li> <li>• Vital structures in the approach path (large vessel, bowel)</li> </ul>

Days of required hospitalisation: 2-5 days

**Expected outcome:**

- Relief in pain and tenderness within 6-8 hrs
- Resolution of fever within 24 hours

**Associated adverse events that may occur:**

- Vasovagal syncope (manifested as sweating, hypotension, bradycardia and loss of consciousness)

An ultrasound image showing a drainage catheter (arrow) placed within a liver abscess

**How to prevent vasovagal syncope: Ensure the following**

- Reassure the patient about the procedure
- Place a large bore (18G/20G) IV cannula in the arm before the procedure
- Keep normal saline infusion bag ready
- Atropine IV to be available for use

**How to treat vasovagal syncope**

- Raise the legs of the patient to prevent peripheral venous pooling
- Inject Atropine 0.6 mg IV if the heart rate is < 60/min (usually responds to this otherwise the same dose can be repeated after 5 min)

COMPLICATIONS	WHEN TO TAKE OUT THE CATHETER:
<ul style="list-style-type: none"> <li>• Injury to vessels in vicinity of the abscess</li> <li>• Injury to the pleura in case of liver and splenic abscesses</li> </ul>	<ul style="list-style-type: none"> <li>• When the output is &lt;10 ml/24 hours</li> </ul>

#### ALGORITHM FOR IMAGE GUIDED ABSCESS DRAINAGE

```

    graph TD
      A[Patient with abdominal pain, high grade fever, malaise (suspected intra abdominal abscess)] --> B[Laboratory and imaging investigations (Ultrasonography and CT) to confirm the diagnosis]
      B --> C[Start medical treatment]
      C --> D[Symptoms resolve after 3-5 days]
      D --> E{Yes}
      D --> F[No improvement/Patient develops signs such as increasing abdominal pain, tachycardia, hypotension]
      E --> G[Follow up imaging ultrasound at 1 month]
      G --> H[Continued medical Treatment]
      F --> I[Percutaneous image guided drainage of abscess]
      I --> H
      I --> J[Abscess volume > 100ml Superficially located liver abscess at risk of rupture into pericardium/peritoneum]
      J --> I
  
```

**Immediate step to be taken if warning signs (as shown in red flag) occur:** Clamp the drainage catheter (Do not take it out), fast fluid infusion to be started

**Steps to be taken once complication is recognised:**

- Appropriate imaging to look for source of bleeding (CT angiography followed by DSA if necessary)
- CT thorax if pleural breach is suspected

**POST PROCEDURE WARNING SIGNS SIGNIFYING COMPLICATIONS**

- Frank blood in the drainage tube (haemorrhage)
- Drop in BP with tachycardia (haemorrhage)
- Patient developing breathlessness/desaturation (pneumothorax)

AFTER CARE IN CASE OF UNCOMPLICATED CASES	PATIENT SUITABLE FOR DISCHARGE	FOLLOW UP
Continue with standard medical treatment as mentioned above Investigation: Ultrasound on day 1 and day 3 post drainage	Afebrile patient with resolved leucocytosis	Repeat ultrasound at 1 month to look for residual abscess

#### ABBREVIATIONS

**CBC:** Complete Blood Count    **CT:** Computed Tomography    **HBs Ag:** Hepatitis B surface Antigen    **LFT:** Liver Function Test  
**ESR:** Erythrocyte Sedimentation Rate    **HIV:** Human Immunodeficiency Virus    **USG:** Ultrasonography

**DRAIN THE ABSCESS BEFORE IT DRAINS A LIFE**

This STW has been prepared by national experts of India with feasibility considerations for various levels of health-care systems in the country. These broad guidelines are advisory, and are based on expert opinions and available scientific evidence. There may be variations in the management of an individual patient based on his/her specific condition, as decided by the treating physician. There will be no indemnity for direct or indirect consequences. Kindly visit the website of ICMR for more information: [icmr.gov.in](http://icmr.gov.in) for more information. ©Indian Council of Medical Research, Ministry of Health & Family Welfare, Government of India.
